

# IMPROVING HF GFLASH SIMULATIONS AT CMS

**EDUARDO IBARRA GARCÍA PADILLA<sup>1</sup>**

**<sup>1</sup>UNIVERSIDAD NACIONAL AUTÓNOMA DE MÉXICO**

August, 2014

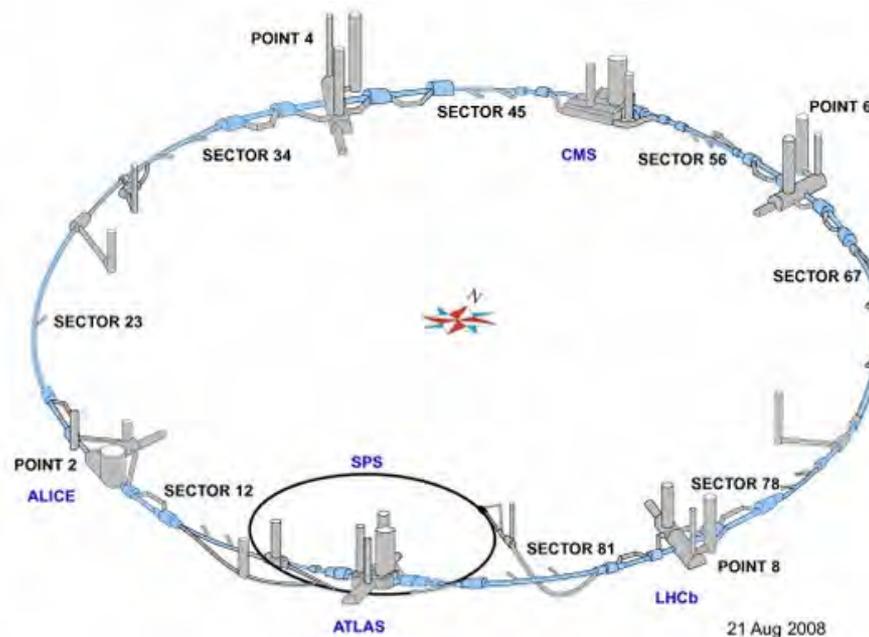

# OUTLINE

- **LHC and CMS**
- **Hadron Forward Calorimeter**
- **EM Showers**
- **GFlash**
- **Improving speed**
- **Tuning GFlash**

# INTRODUCTION

- **LHC**
- CMS
- HF Calorimeter
- EM Showers
- GFlash

Located at CERN Switzerland-France.  
**ALICE, ATLAS, CMS, LHCb**

# LHC NOW

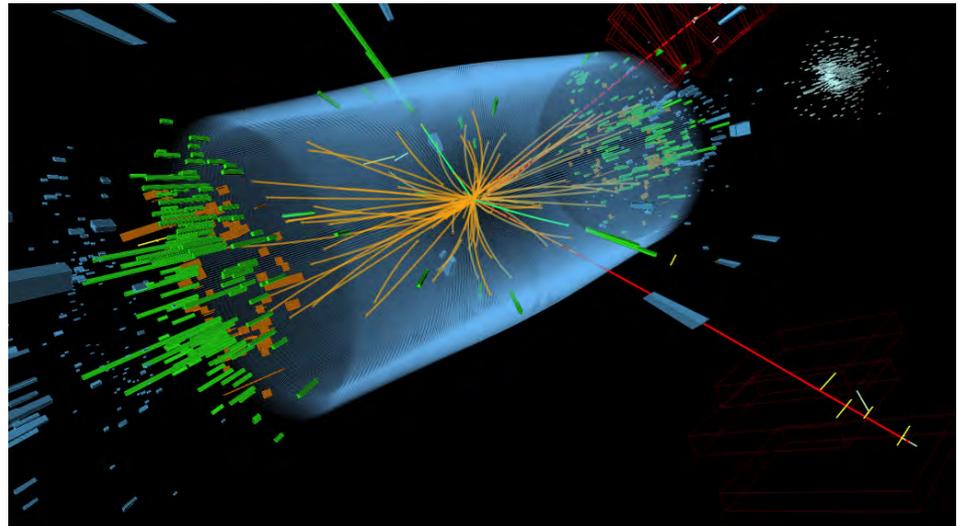

- **LHC**
- **CMS**
- **HF Calorimeter**
- **EM Showers**
- **GFlash**
- Proton-Proton collisions
- Center of mass energy: 8 TeV
  - Signatures of the Higgs boson
  - Super-symmetric particles
  - Extra dimensions
  - Dark matter
  - Etc...

LHC ring

# LHC FUTURE

- **LHC**
- **CMS**
- **HF Calorimeter**
- **EM Showers**
- **GFlash**
- 2019
- Center of mass energy: 14TeV
  - Better measurement techniques
  - Faster and more accurate simulations

MÉXICO

## CMS DETECTOR

Total weight : 14,000 tonnes  
Overall diameter : 15.0 m  
Overall length : 28.7 m  
Magnetic field : 3.8 T

STEEL RETURN YOKE  
12,500 tonnes

### SILICON TRACKERS

Pixel ( $100 \times 150 \mu\text{m}$ )  $\sim 16\text{m}^2 \sim 66\text{M}$  channels  
Microstrips ( $80 \times 180 \mu\text{m}$ )  $\sim 200\text{m}^2 \sim 9.6\text{M}$  channels

4 Tesla to bend particles' paths

### MUON CHAMBERS

Barrel: 250 Drift Tube, 480 Resistive Plate Chambers  
Endcaps: 468 Cathode Strip, 432 Resistive Plate Chambers

### PRESHOWER

Silicon strips  $\sim 16\text{m}^2 \sim 137,000$  channels

### FORWARD CALORIMETER

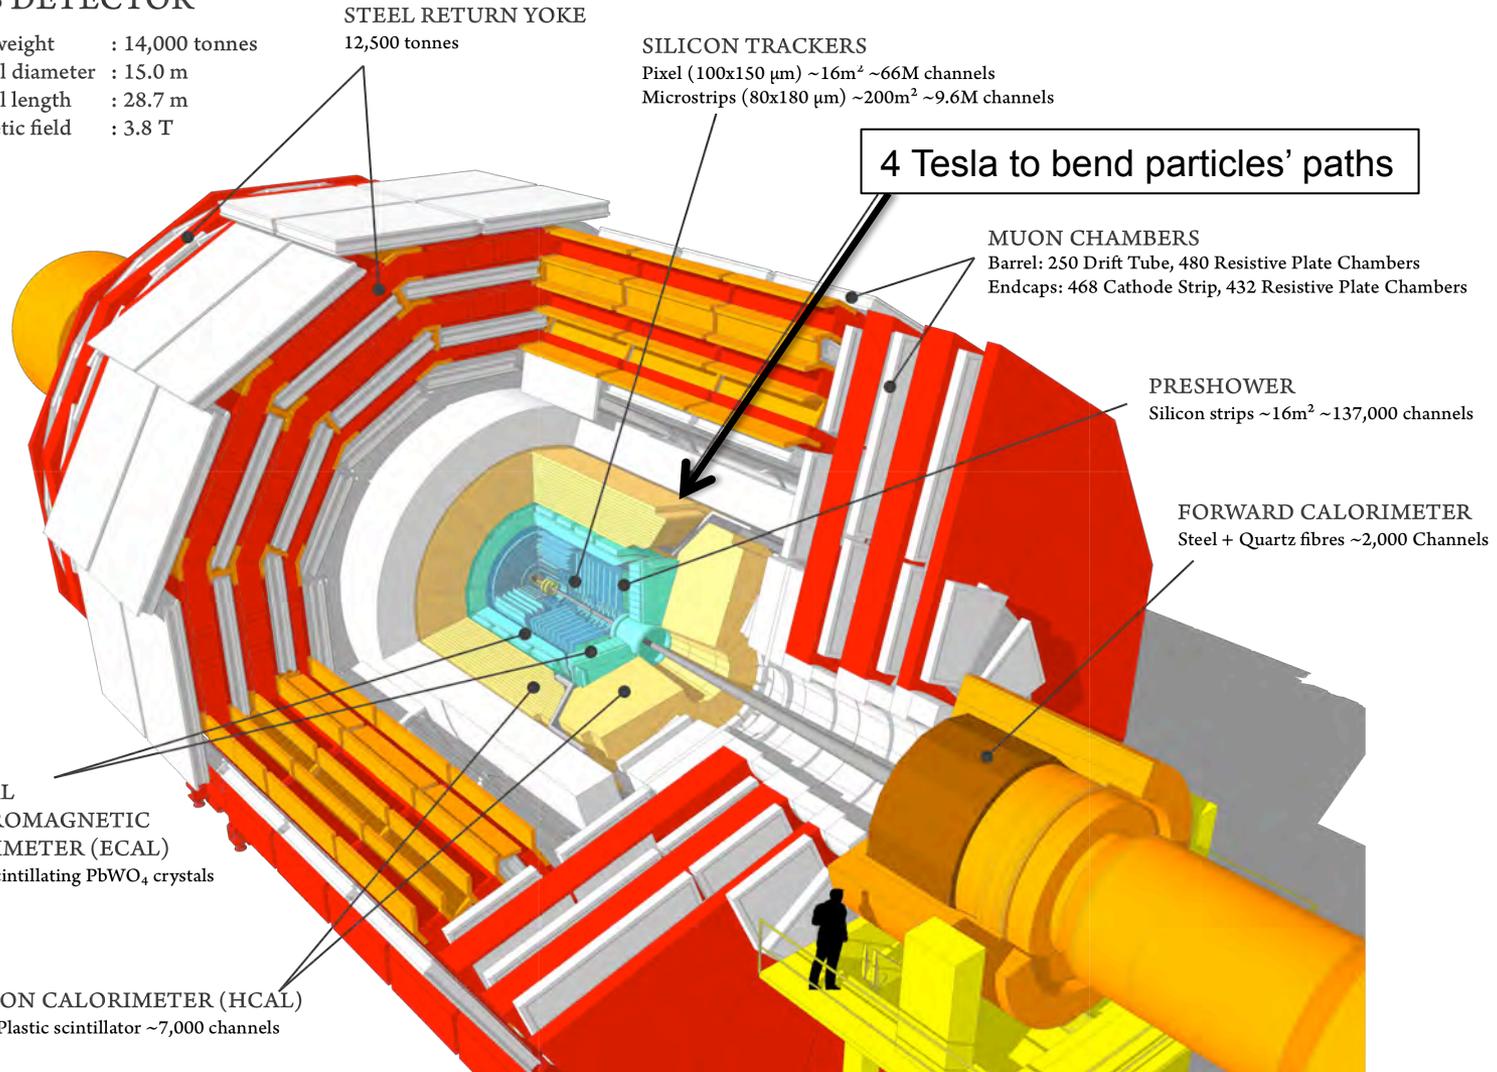

Steel + Quartz fibres  $\sim 2,000$  Channels

### CRYSTAL ELECTROMAGNETIC CALORIMETER (ECAL)

$\sim 76,000$  scintillating  $\text{PbWO}_4$  crystals

### HADRON CALORIMETER (HCAL)

Brass + Plastic scintillator  $\sim 7,000$  channels

# SILICON TRACKER

MÉXICO

## CMS DETECTOR

Total weight : 14,000 tonnes  
Overall diameter : 15.0 m  
Overall length : 28.7 m  
Magnetic field : 3.8 T

STEEL RETURN YOKE  
12,500 tonnes

measure the positions of passing charged particles  
allows us to reconstruct their tracks.

SUPERCONDUCTING SOLENOID  
Niobium titanium coil carrying ~18,000A

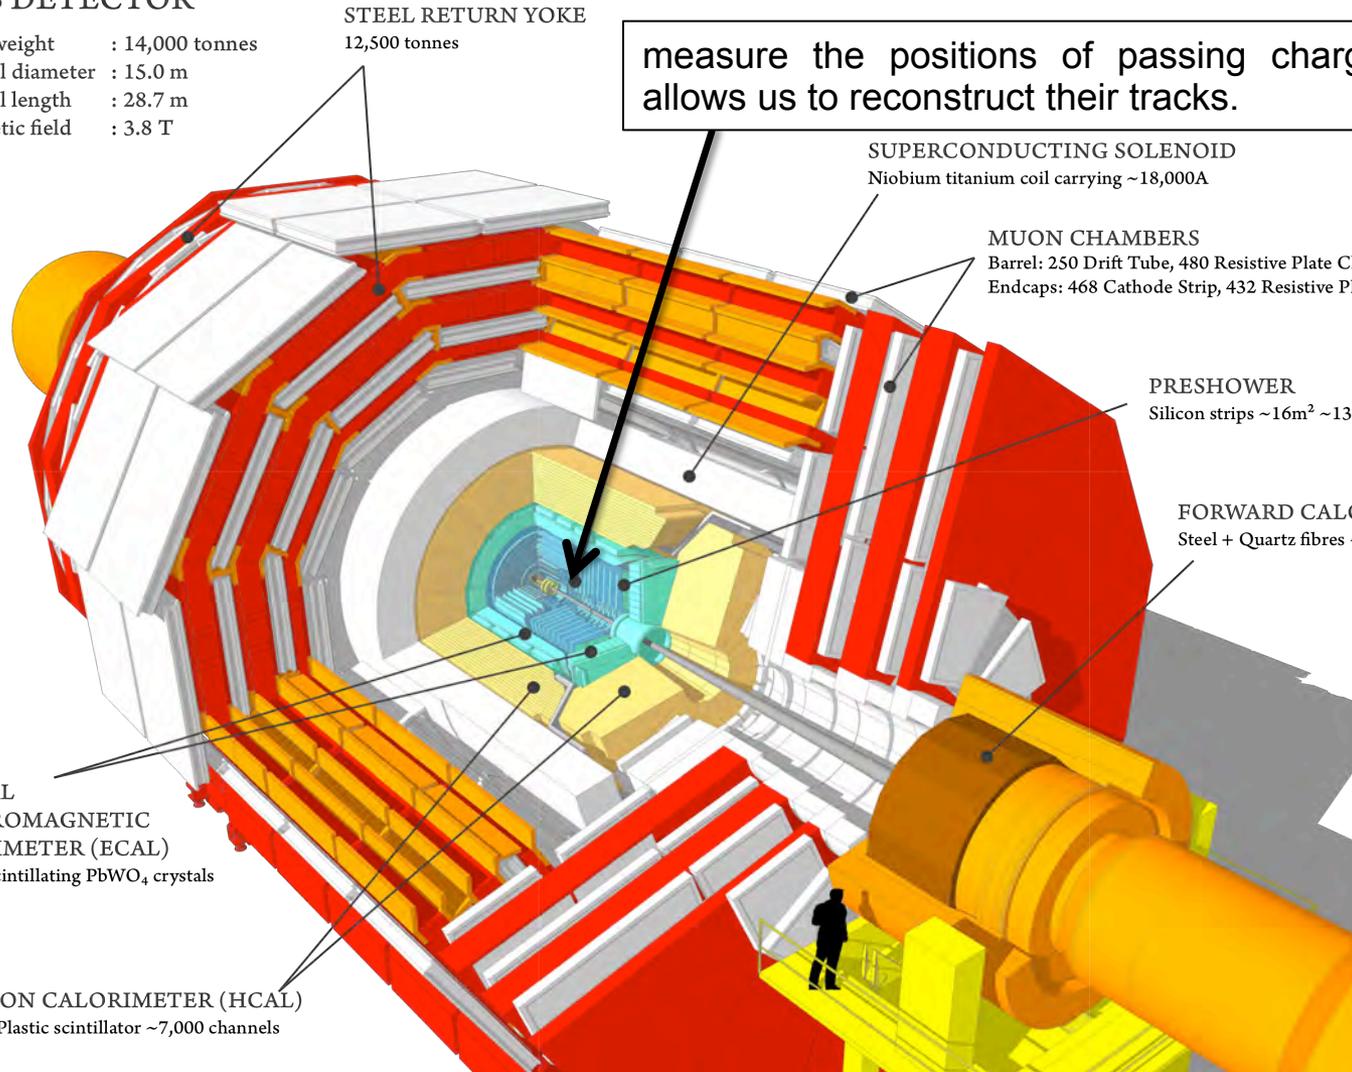

MUON CHAMBERS  
Barrel: 250 Drift Tube, 480 Resistive Plate Chambers  
Endcaps: 468 Cathode Strip, 432 Resistive Plate Chambers

PRESHOWER  
Silicon strips ~16m<sup>2</sup> ~137,000 channels

FORWARD CALORIMETER  
Steel + Quartz fibres ~2,000 Channels

CRYSTAL  
ELECTROMAGNETIC  
CALORIMETER (ECAL)  
~76,000 scintillating PbWO<sub>4</sub> crystals

HADRON CALORIMETER (HCAL)  
Brass + Plastic scintillator ~7,000 channels

# ECAL

## CMS DETECTOR

Total weight : 14,000 tonnes

# HF CALORIMETER

- LHC
- CMS
- **HF Calorimeter**
- EM Showers
- GFlash
- 11.15m away from the interaction point
- Pseudorapidity region  $3 < |\eta| < 5$ .
- Steel absorbers and quartz fibres

Pseudorapidity diagram and location of HF Calorimeter

# HF CALORIMETER

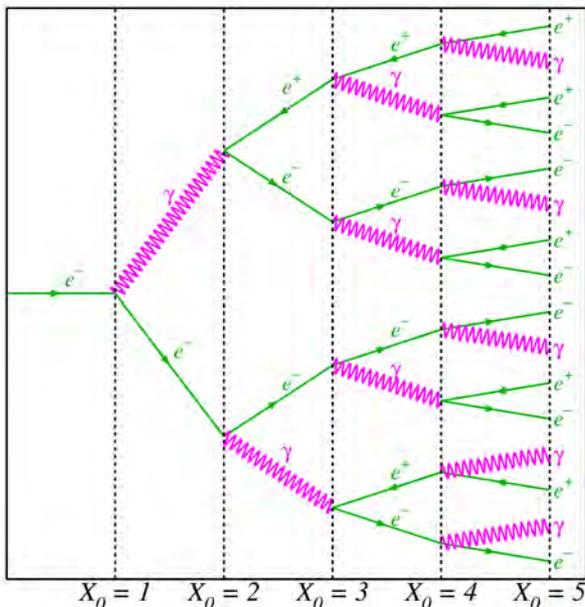

UNIVERSIDAD NACIONAL  
AUTÓNOMA DE  
MÉXICO

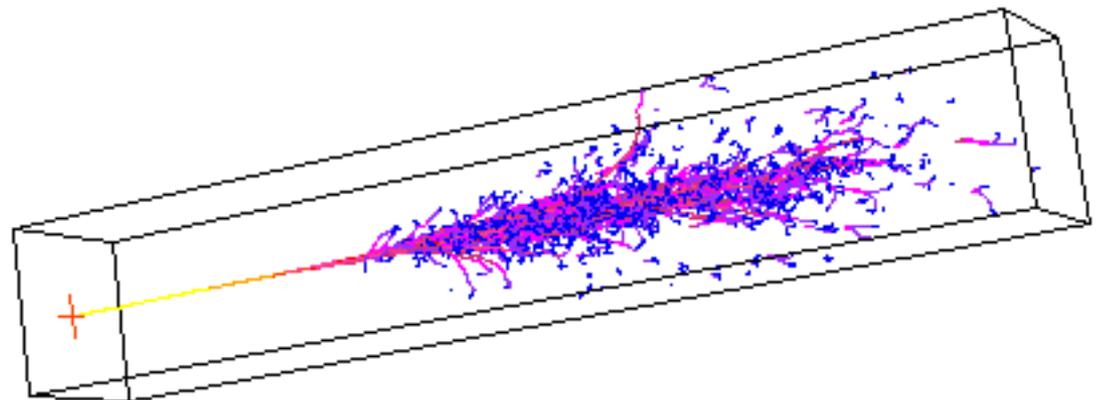

HF Calorimeter wedges. In white, PMT's.

# EM SHOWERS

- LHC
  - CMS
  - HF Calorimeter
  - **EM Showers**
  - GFlash
- Electrons radiate photons
  - Photons pair produce
  - Number of particles increases exponentially.
  - Each pair production and Bremsstrahlung radiation the energy of the particles reduces.

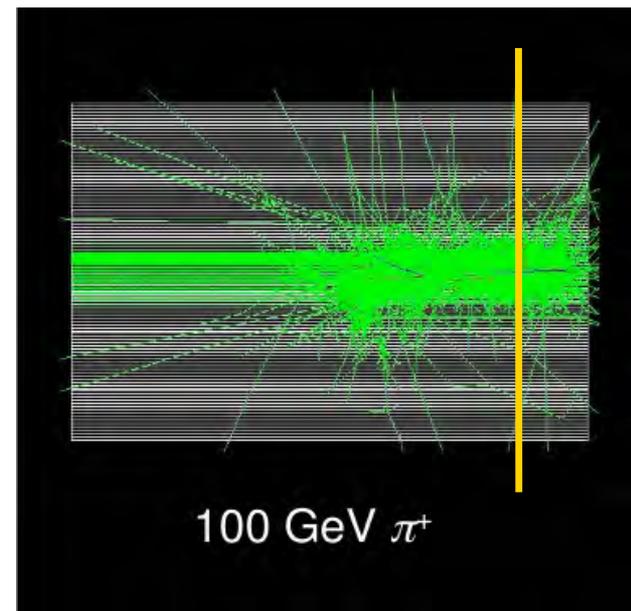

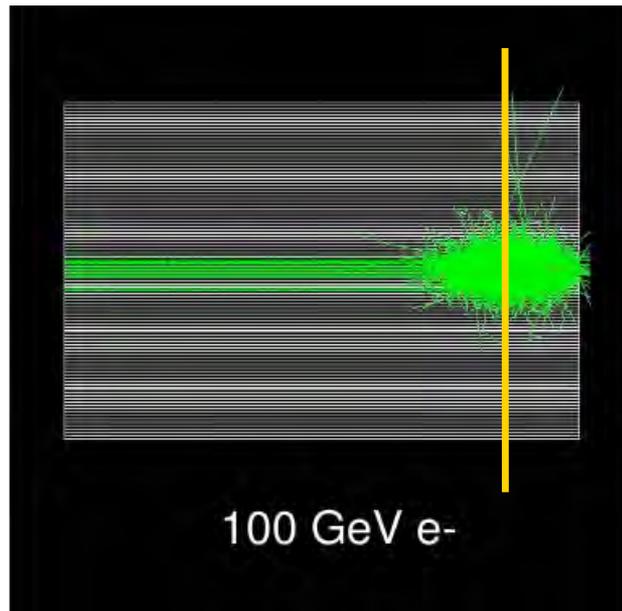

Electron EM Shower diagram and EM Shower profile simulation

# EM SHOWERS & HF CAL

- LHC
  - CMS
  - HF Calorimeter
  - **EM Showers**
  - GFlash
- Long (L) and short (S) fibres to differentiate showers from electromagnetic and hadronic particles
  - 165 cm (L) and 143 cm (S)

← Beam

# GFLASH

- LHC
  - CMS
  - HF Calorimeter
  - EM Showers
  - **GFlash**
- Why do we need GFlash?
    - Full Geant4 simulation → might need days to simulate 1 event.
    - Previous CMS Simulation has a problem to simulate HF Noise because it killed particles immediately when they entered detectors and replaced them with Shower Library.

# GFLASH

- ◆ The spatial energy distribution of EM Showers is given by 3 Probability Distribution Functions (pdf)

$$dE(\vec{r}) = E f(t) f(r) f(\phi) dt dr d\phi$$

- $t$  = Longitudinal shower distribution
  - $r$  = Radial shower distribution
  - $\Phi$  = Azimuthal shower distribution (assumed to be distributed uniformly)
- ◆ The average longitudinal shower profile (in units of radiation length):

$$\left\langle \frac{1}{E} \frac{dE(t)}{dt} \right\rangle = f(t) = \frac{(\beta t)^{\alpha-1} \beta \exp(-\beta t)}{\Gamma(\alpha)}$$

- ◆ The average radial energy profile (in units of Moliere radius):

$$f(r) = \frac{1}{dE(t)} \frac{dE(t, r)}{dr}$$

# GFLASH 2012

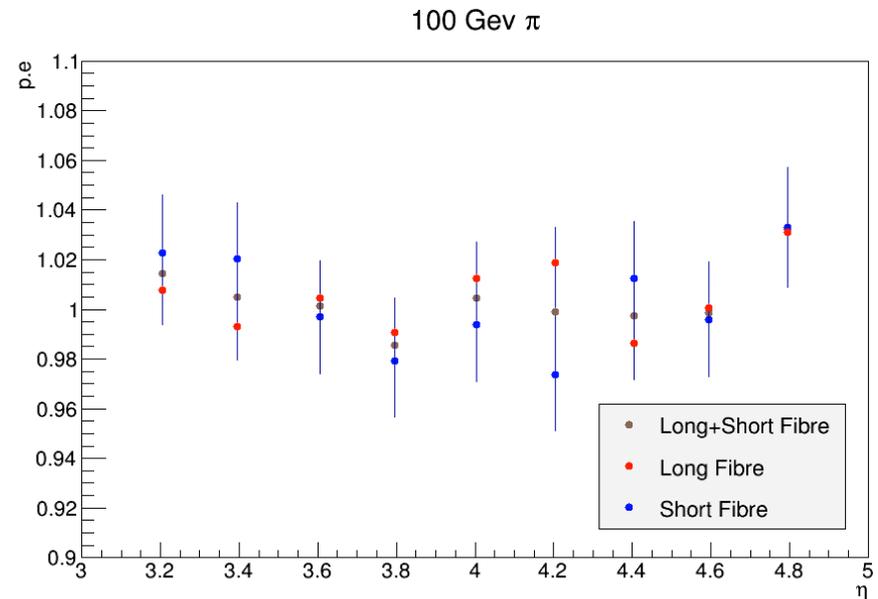

- LHC
  - CMS
  - HF Calorimeter
  - EM Showers
  - **GFlash**
- Tested against:
    - Test Beam Data
    - Collision Data
    - Shower Library (previous HF CMS Simulation)
  - Noises simulation
  - Very high energy particles
  - Better agreement to Test Beam Data
  - Good agreement to CMS Collision Data
  - 10000 times faster than Geant4.
  - **Aim → Faster and more precise**

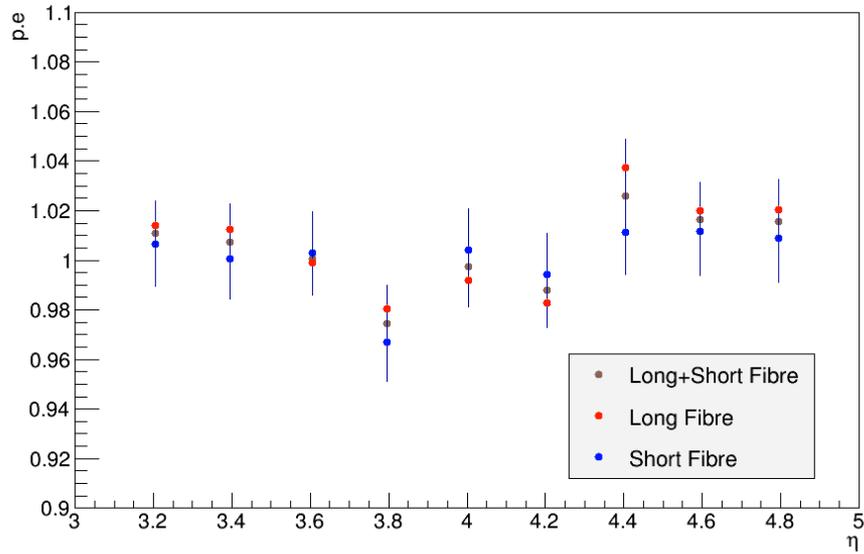

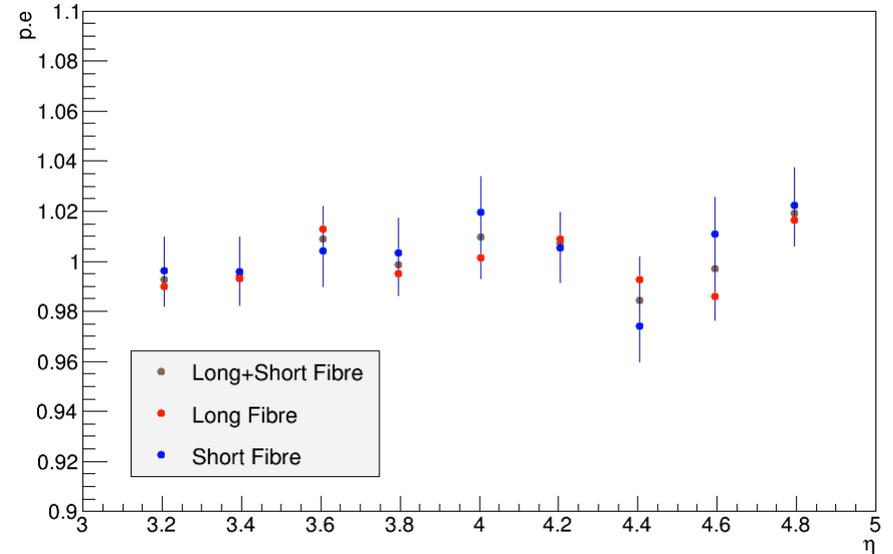

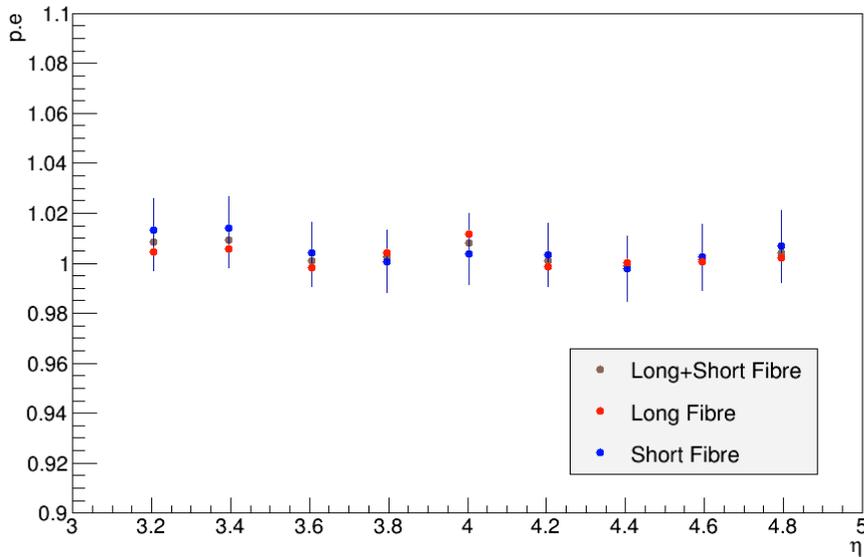

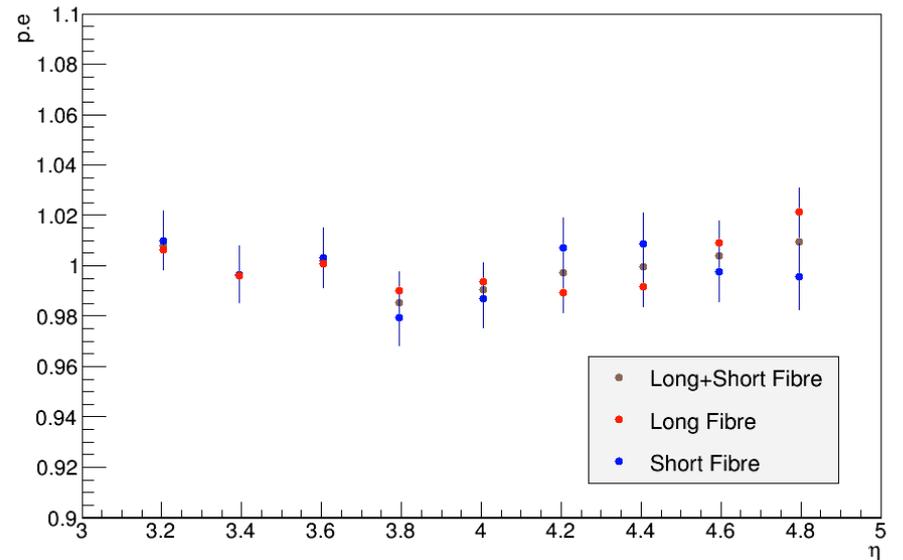

# METHODOLOGY

- 1 Gathering previous results of GFlash simulations.
  - 1 Photoelectron (p.e.) counts varying the incoming energy of the particle  $E_0$ .
  - 2 p.e. counts varying the  $\eta$  of entrance.
  - 3 p.e. counts for both  $e^-$  and  $\pi^+$ .
- 2 Set a soft neutron threshold. We varied the energy of this threshold from 1.0 GeV to 1.5 GeV.
- 3 Comparing the obtained data we determined the threshold that is more convenient.
- 4 Compare average computing times with and without the cut and test the results obtained with the 1.2 cut vs Test Beam Data.
- 5 Tune the simulation using the Test Beam Data.

# 1.2 GEV CUT RESULTS

- Plot the ratio:
  - p.e. (1.2 cut)/p.e. (no cut)  
vs  $\eta$
  - 100 to 1000 GeV
  - $\pi^+$
- % Discrepancies < 4%
- Simulation runs 76% faster

250 GeV  $\pi$ 500 GeV  $\pi$ 750 GeV  $\pi$ 1000 GeV  $\pi$ Plot p.e. ratio vs  $\eta$  for 100, 250, 500 and 1000 GeV pions

# SOFT NEUTRON THRESHOLD RESULTS

Energy [GeV]	1.0	1.1	1.2	1.3	1.4	1.5
% Faster	30	45	76	81	84	86
Mean Ratio	1.000	1.003	0.999	0.997	1.002	0.997
Mean Relative Error %	1.15	1.04	1.24	1.36	1.34	1.32
Std. Dev. RE	0.59	0.49	0.32	0.42	0.80	0.87

Table 1: Soft Neutron Threshold results

# TUNING THE SIMULATION

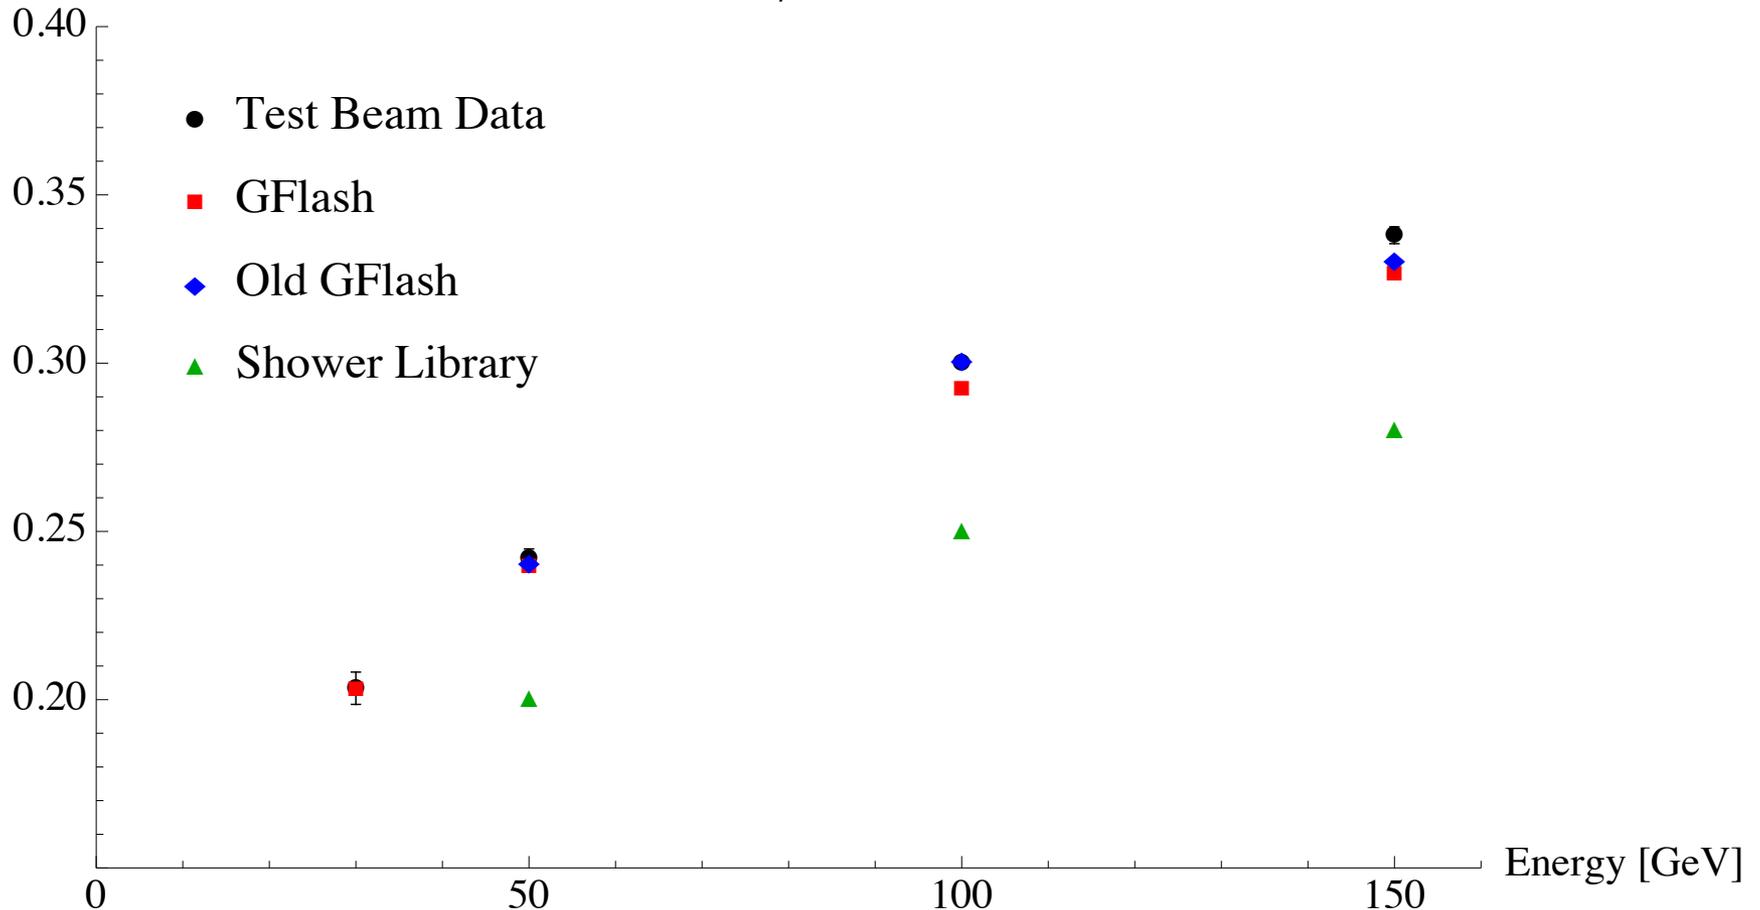

- 4 responses:
  - Ratios of the energies deposited in Long and Short fibres for electrons and pions.
    - Se/Le
    - Lp/Le
    - Sp/Le
    - Sp/Lp
- $e \rightarrow$  electron,  $p \rightarrow$  pion,  $S \rightarrow$  short fibres,  $L \rightarrow$  long fibres

# TUNING THE SIMULATION

- 10 parameters
- $3^k$  Factorial design experiment:
  - Define 3 levels for each factor (+,=,-)
  - $3^{10}$  experiments to be done!!!!
- Defined 3 blocks (3,4,3)
  - Do all possible combinations per block and find correlations between those parameters.
- Define new levels and blocks. Repeat.
- Wrote a program that aided us in doing statistical analysis.
- **1.15% mean discrepancy when compared to Test Beam Data.**
- **Reduced the error by 55% after tuning.**

# SANITY CHECK

## Linear response

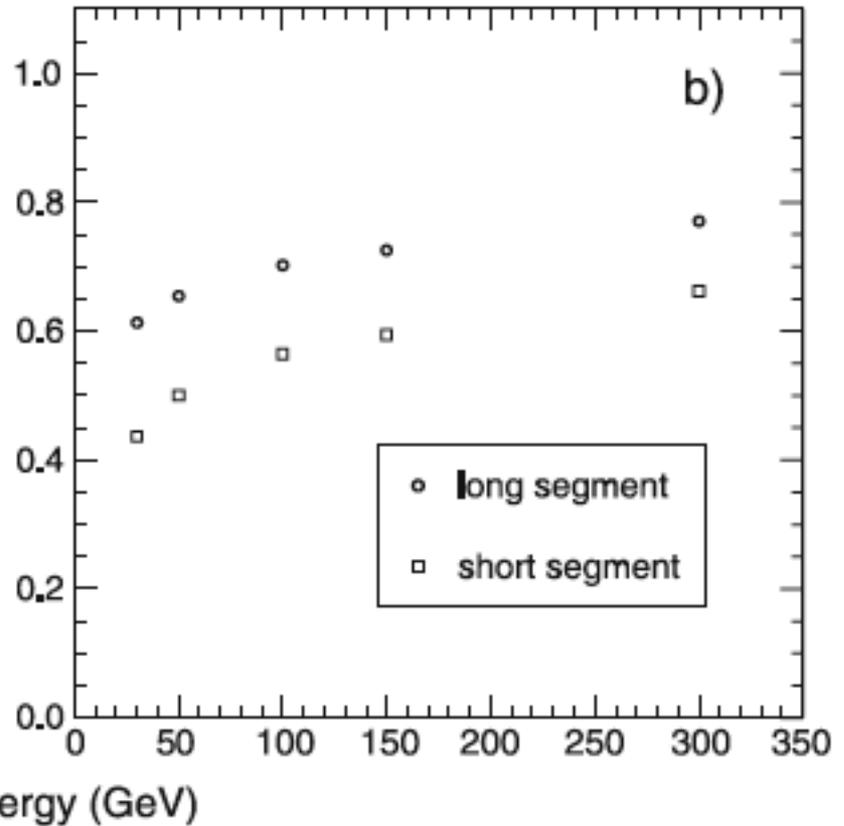

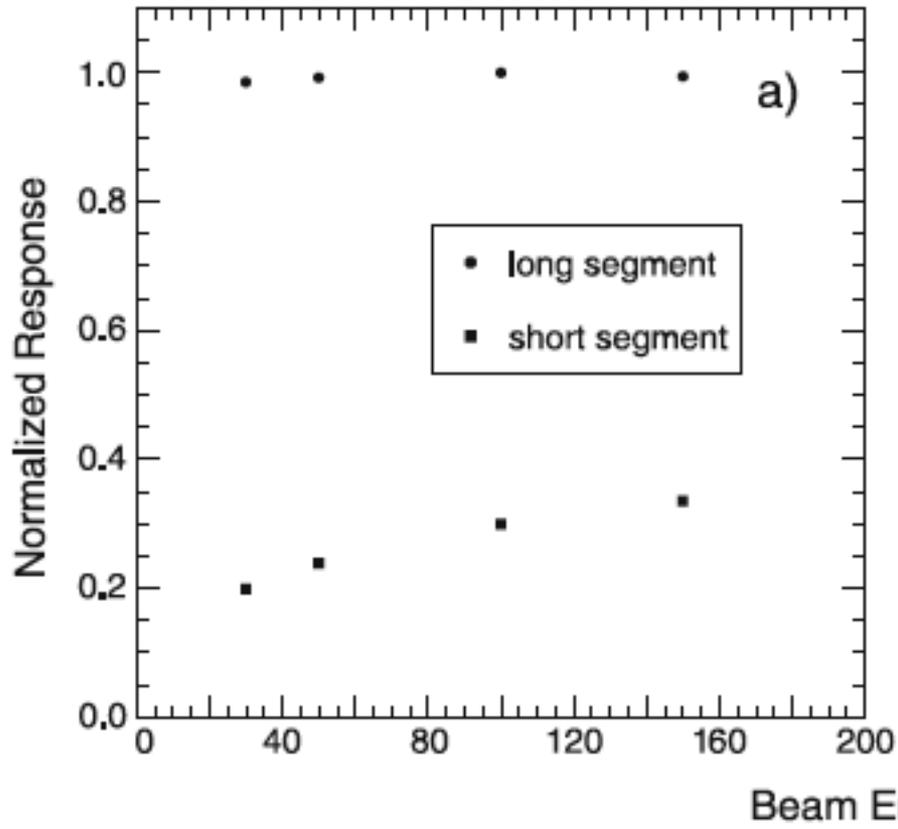

GFlash has a linear energy response for electrons and pions with energies from 30 to 1000 GeV

# SANITY CHECK

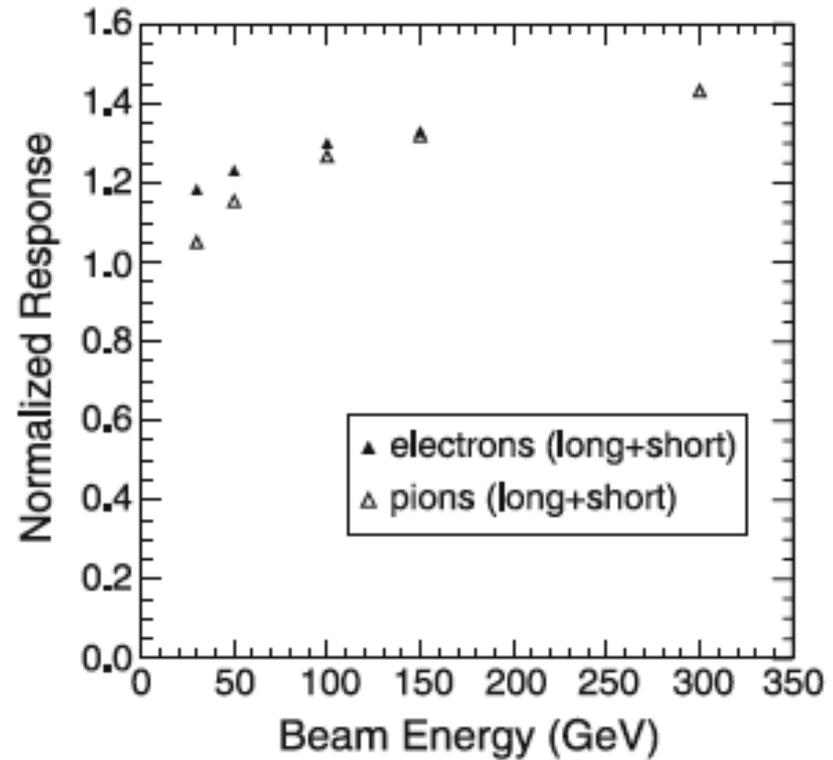

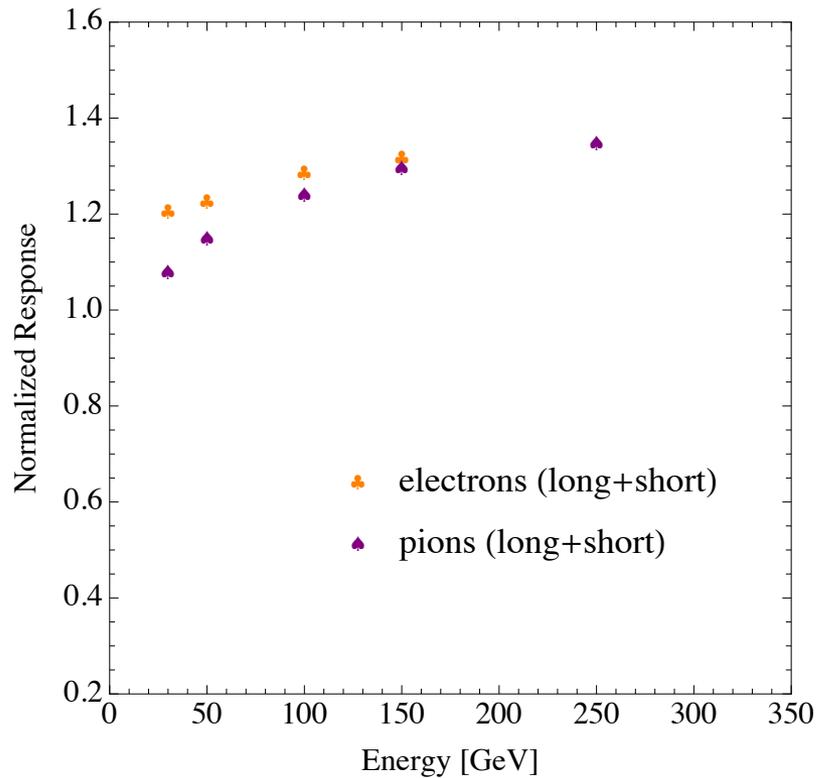

The normalized response for electrons and pions as a function of beam energy for our simulation.

# SANITY CHECK

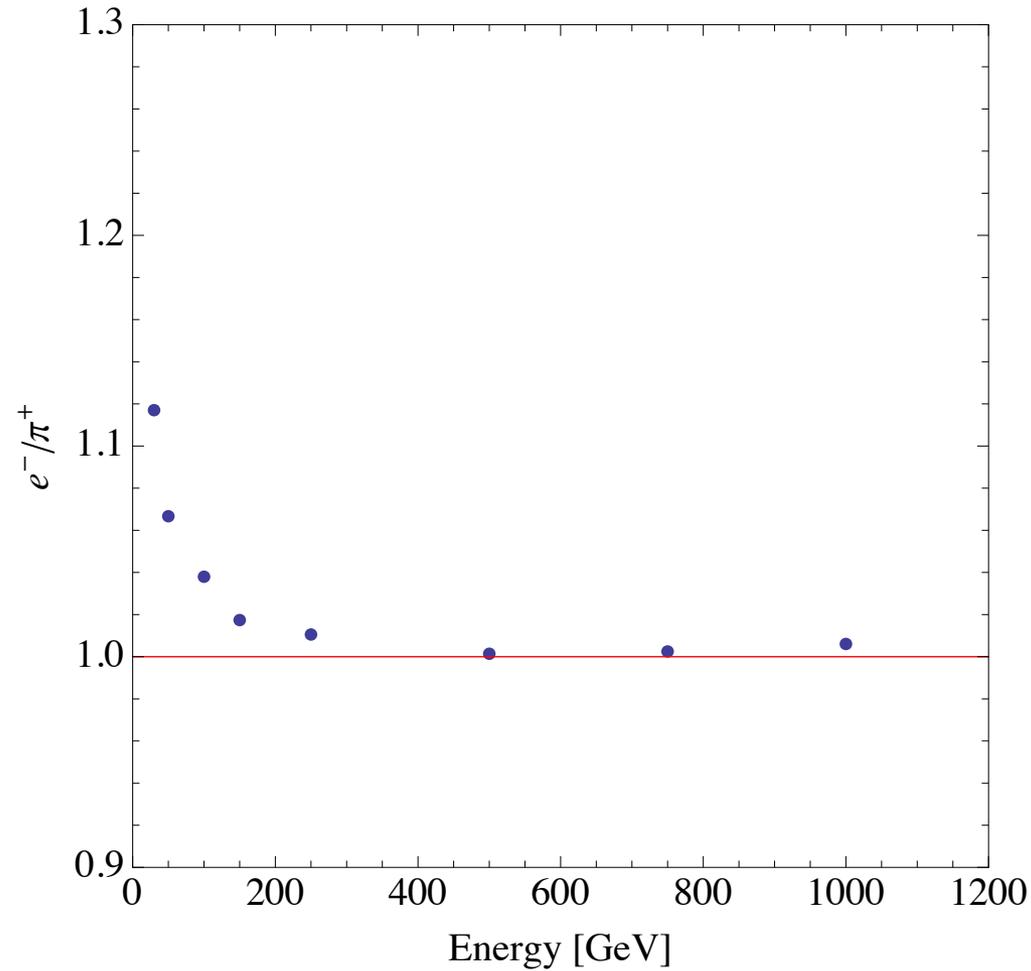

The normalized response for electrons and pions as a function of beam energy test beam data results.

# SANITY CHECK

The L+S response of the detector for electrons and pions are shown as a function of beam energy. In the left our simulation, in the right test beam data results.

# SANITY CHECK

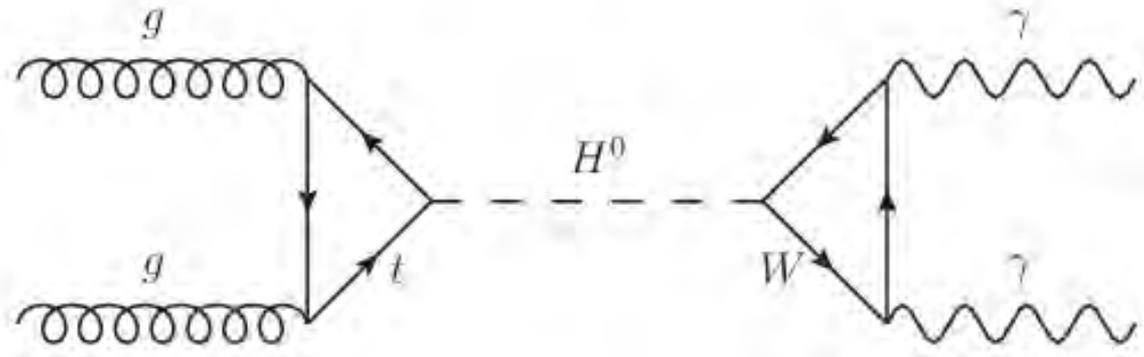

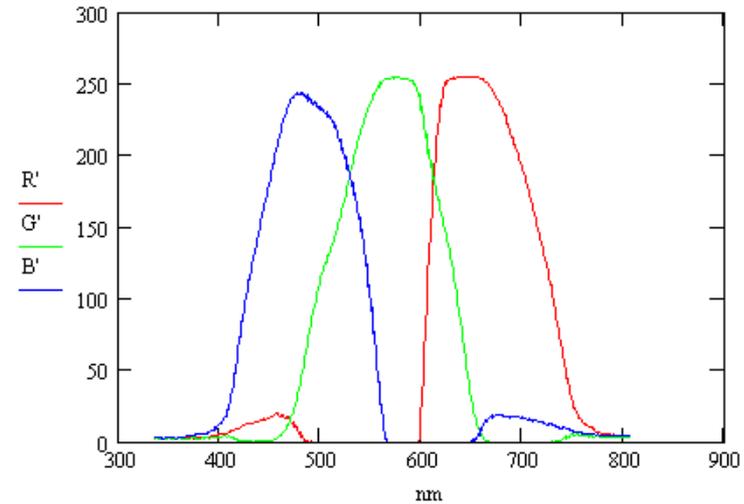

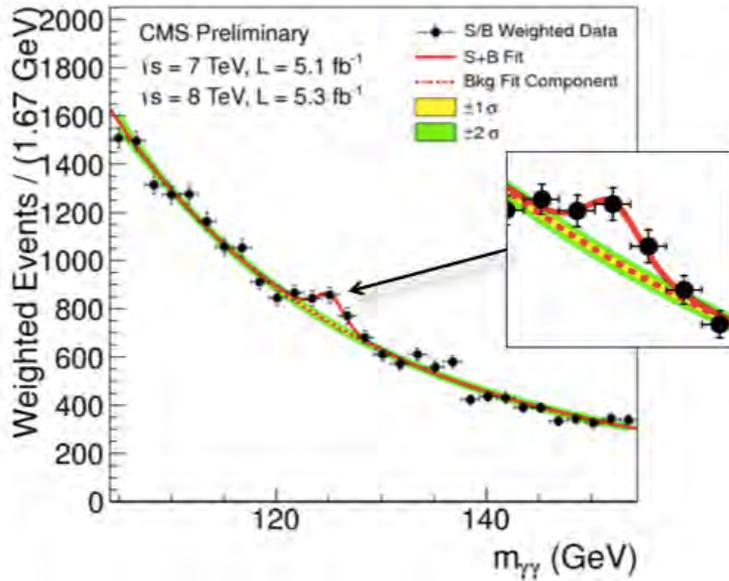

The  $e/\pi$  ratio varies from 1.14 to 1.01 in the tested energy range, and is essentially flat at high energies

# LOOKING FOR NON SM HIGGS

UNIVERSIDAD NACIONAL  
AUTÓNOMA DE  
MÉXICO

Higgs “bump”, What if the bump is a superposition of several Higgs bosons? Feynman diagram of a typical diphoton decay

# CONCLUSIONS AND FORTHCOMING RESEARCH

- We were able to tune HF Gflash simulations:
  - Reduced the error by 55%.
  - Runs 76% faster.
  - With 1.15% mean discrepancy when compared to Test Beam Data.
- Extend the simulation to the other calorimeters.
- Span a wider  $\eta$  range.
- Aim for a better precision.
